# TAHOMA T#

## Modular Multiviewers

The T# is a modular multiviewer architecture that accepts a mix of various input & output cards and allows sending any input to any output.

Two chassis with redundant power supplies are available: Single 4 RU with 8 input slots and 4 output slots can have a maximum 64 x 16 configuration, when two 4RU chassis are cascaded together can have a maximum of 128 x 16 configuration. A more economical 2RU chassis with 4 input slots and 1 output slot up to a maximum 32 x 4 configuration. More boards can be added to populate empty slots.

Each input slot can be equipped with one VSM input card - that handles 8 signals, associated with various rear input modules (UIM-xxx) accepting 4 or 8 inputs with different signal formats plus GPI inputs.

Each output slot can be equipped with one OPM output card. The OPM cards handle 4 outputs at a time, associated with various rear output modules that provide one HDMI (1080p) & SDI (1080p/i) pair for each of the four outputs. Depending on the rear output model, SDI can also be available over Fiber. The UHD OPM cards handle a single UHD output, associated with the UHD rear output module.

The first output card has a daughter board that supports control signals: IP, RS-232, GPI, Reference & LTC inputs, AA and AES monitoring outputs.

On Screen Display (OSD): The T# has the following capabilities: Borders, UMDs, OMDs, standalone labels, meters, markers, various video and audio alarm tags, digital and analog clocks, logos. It supports the TSL protocol over IP for dynamic tallies and labels.

It is configured using the free JDirector Configuration SW and can store up to 30 Presets. It supports various control HW and SW control panels and the AXP control protocol.

## Architectural Concepts

### Frame sizes

- T# comes in 3 different frame sizes, 2 RU and 4 RU. All frames are modular, therefore different I/O modules can be inserted to form different sizes of multiviewers, and all boards are interchangeable between the frames
- T# comes standard with redundant power supplies
- Cooling flow is front to back

### How to Cascade two T# 4RU frames together to expand up to 128 inputs

### All the Outputs will come from Frame #2.

- The Maximum Configuration can be up to 128 (1080P) inputs and 16 (1080P) outputs in either SDI or HDMI
- The Maximum Configuration in UHD is 64 12G SDI or HDMI 2.0
- Different types of HDMI or SDI can be mixed and matched on the input as well as output
- The outputs resolutions are independent of input resolutions
